Ergonomic background

Multiple studies have found that the use of two or more screens can lead to substantial improvements in performance (University of Utah, 2008; Colvin et al., 2004; Czerwinski et al, 2003).

Placing the screen too low can lead to tension in the upper neck. Placing it too high (the top should not be above eye level) can also lead to problems. Even more important is the adjustability of the depth, ensuring an optimal viewing distance. This allows you to better take in information and puts the least amount of strain on the eyes. This optimal screen position works better, more comfortably and increases productivity by 10% when compared to an incorrect positioning (Sommerich et al,1998).
