EVIDGOM ®

Natural frequency : (1)
2,5 to 7 Hz

DESCRIPTION

The EVIDGOM® mount is formed from two thick conical membranes joined at their bases to create a highly elastic mounting.

There are two variations :
- all rubber EVIDGOM®;
- EVIDGOM® with bonded fixing;

OPERATION

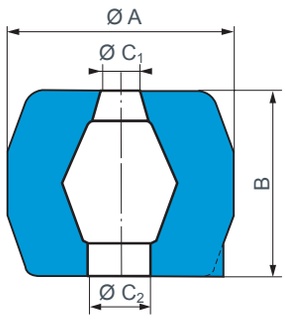

The design of the EVIDGOM® mount gives the following basic characteristics:
- a very high axial elasticity;
- very low natural frequency (a few Hertz);
- progressive buffer against shocks or accidental overload.

Advantages
- As the load/deflection curve has a point of inflection, a suspension may be designed to have a sub-tangent greater than the static deflection.
- The elastomer used provides intrinsic damping with a corresponding ability to absorb energy which gives appreciable advantages over metallic springs.

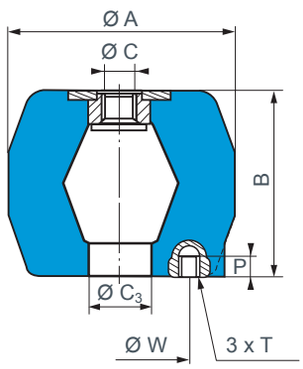

Recommendations
- The selection of a low natural frequency (large deflection) must not be allowed to endanger the stability of the suspension (tall equipment).
- In certain cases (use under maximum load) the use of side stops is recommended.

1) the indicated natural frequency, are valid for the maxi loads of the ranges of use quoted in the paragraph : TECHNICAL CHARACTERISTICS.
