Protection – ATEX

Explosion Protection Catalogue | Version 03

SCHMERSAL

www.schmersal.com

You will also find detailed information on our entire product progamme on our website: www.schmersal.com.

Online documentation in six languages

The online catalogue for our customers is permanently updated. The Main catalogue can be consulted on the Internet in as much as six languages.
The technical data of our entire product range are available 24/7, always up-to-date. The declarations of conformity, the test certificates and the mounting instructions can be viewed or even downloaded as well.

Service for designers

The online catalogue also includes the technical drawings of our products – a special service to designers. In this way, they can be downloaded and directly imported into CAD-systems.
The Schmersal homepage furthermore contains up-to-date information on general subjects, technical articles on machine safety as well as news regarding events and trainings. To be bookmarked!

The direct way

If you need further information or you want personal advice, you can call us as well:
+ 49-(0) 2 02-64 74-0.

The addresses of our representations in Germany and abroad can be found on the front pages of this catalogue.

We are at your disposal – anyplace, anywhere, anytime!

Attention!

The devices presented in this range are not intended for private consumers, i.e. they are not consumer products within the meaning of the European Directives (in Germany within the meaning of Section 5 GPSG) or other national laws. Assembly and commissioning of the devices requires personnel with the appropriate basic electrotechnical training or personnel who have been instructed accordingly.

The data specified in this catalogue are carefully checked typical standard values.
Subject to technical modifications and error.

The basics of explosion protection

The implementation of the ATEX Directives (ATEX: ATmosphères EXplosibles) in Europe has changed the way of thinking with regard to the explosion protection. The manufacturers must follow the directive 94/4/EC to fulfill the harmonised standars in Europe. The directive is obligatory in all Member States and transposed into national law. This was carried out until 2003. On the other side the users have to fulfill the directive 1999/92/EC regarding the basic safety and health requirements for operation. Both Directives are based upon the standards listed in the Official Journal (OJ) of the European Commission.
Not only the gas explosive protection is now standardised, but also the protection for dust atmospheres. In a few countries, e.g. in Germany, explosion protection regulations existed already at national level, however not harmonised.

Due to the internationalisation and the standardisation on EN basis, the standards defining the requirements on equipment to be used in explosive atmospheres will gradually be replaced by the European Standards series EN 60079. Hybrid mixtures from gas and dust are included in the standardisation work as well. The mechanical explosion protection required by the ATEX Directives however still is in its “infancy”.
The comprehensive product portfolio from Schmersal and Elan Schaltelemente complies with the requirements of the standards and directives. Our existing products and our innovations are consistently developed and refined on the basis of the current standards as well as the amendments, which are in the transitional stage.
In this way, both the standard requirements and safety technology are integrated in the potentially explosive areas.

Source of ignition	Examples of the cause
Sparks	Mechanically generated sparks (e.g. by friction, stroke or cutting removal operations), electric sparks
Electric arcs/flashovers	Short-circuit, switching operations
Hot surfaces	Current in electrical installations, heaters and radiators, machining, heating during operation
Flames and hot gases	By combustion reactions, spark projection during welding
Electrical installations	Even extra-low voltages (U < 50 V) still can generate sufficient energy to ignite an explosive atmosphere. Opening/closing of contacts, loose or defective contacts
Static electricity	Separately arranged conductive parts, many plastics
Equalizing currents	Reverse current from generators, earth connection in case of faults, induction
Electromagnetic waves in the 3×10^{11} ... 3×10^{15} Hz range	Laser beam for range finding, especially in case of beam focusing
High frequency 10^4 ... 3×10^{12} Hz	Radio signals, industrial high-frequency generators for heating, drying, cutting, etc.
Lightning	Atmospheric disturbances
Ionizing radiation	X-ray device, radioactive substances, energy absorption leads to heating
Ultrasonic	Energy absorption in solid/liquid substances leads to heating
Adiabatic compression and shock waves	Strokewise opening of valves
Exothermal reactions	Chemical reaction

The basic physic and technical principles
Complete combustion
Combustion or burning is a complex sequence of exothermic chemical reactions. A fire starts when a flammable and/or combustible material with an adequate supply of oxygen is exothermically disintegrated. Depending on the speed of combustion, we speak of deflagration, explosion or detonation.
A complete combustion causes significant damages, which various with the combustion speed.
Order of magnitude of the speed of combustion

Deflagration	cm/s
Explosion	m/s
Detonation	km/s

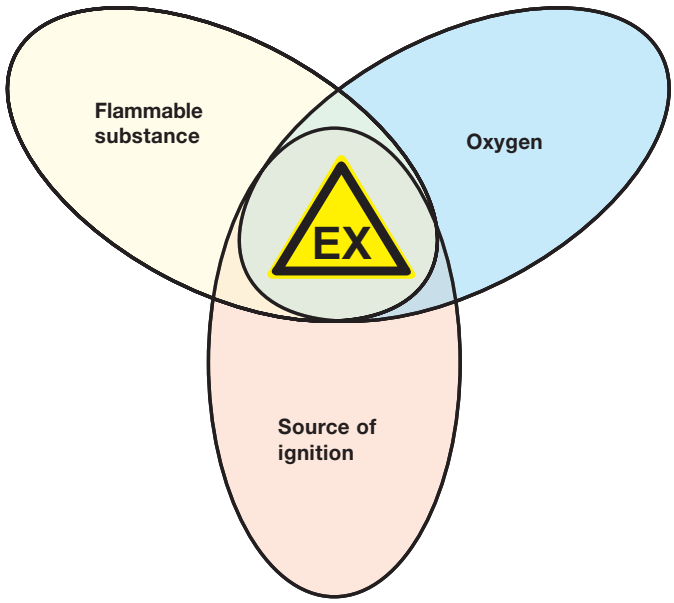

Explosion
An explosion can only occur, when three factors come together: flammable material in ignitable quantities, oxygen and an ignition source. If one component is missing, no exothermic reaction will occur.

Oxygen
When a flammable substance is mixed with oxygen, a potentially explosive mixture is created.
For gases, the concentration ratio determines whether an explosion is possible. The mixture can only be ignited if the concentration of the substance in air is within the lower and upper explosive limits. Mixtures with concentrations smaller or greater these limits will not explode. A few chemically unstable substances (e.g. acetylene, ethylene oxide) have self-decomposing properties and therefore can also produce exothermal reactions without oxygen. In these cases, the upper explosion limit (UEL) is 100 vol. %.
For pressurised gases, the explosion ranges change. Dusts are also classified by a lower explosion limit (approx. at 20…60 g/m³) and an upper explosion limit (approx. at 2…6 kg/m³).

Potentially explosive substance
Any flammable substance in the form of gas, mist, vapour or dust is considered as potentially explosive substance. For mists and dusts, a potentially explosive atmosphere occurs when the drop or the particle size is smaller than 1 mm. Frequently-used mists, aerosols and dusts have a particle size between 0.001 mm and 0.1 mm. Dusts with larger particle sizes are not combustible.
Deposits of dust can be compared to porous elements and have hollow portion of up to 90%. The increase of temperature of dust deposits can cause the spontaneous ignition of the dust-like flammable substance. If a deposit of dust with small particle size is swirled up, the dust, along with the oxygen in the air, forms a combustible dust/air mix. The bigger the size reduction, the higher the explosion danger, since the surface of the hollow space increases. Dust explosions are often the consequence of smouldering dust layers which become stirred up and already carry the ignition initiation.

The potential danger of explosive dust atmospheres and the selection of the appropriate safety measures are evaluated by means of the safety characteristics of the substances concerned. To this end, dusts are classified in accordance with two of their substance-specific properties:
- Conductivity
  Dusts are considered to be conductive when they have a specific electric resistance of up to 10^3 ohmmeters.
- Combustibility
  Combustible dusts are characterised by the fact that they can burn or smoulder when mixed with air and that they form explosive mixtures along with oxygen under atmospheric pressure and at temperatures ranging from – 20°C to + 60°C.

The safety characteristics of swirled up dusts are for instance the minimum ignition energy and the ignition temperature, whereas for deposits of dust the smouldering temperature is a characteristic feature.

The basics of explosion protection

Classification of zones and selection of equipment
Setting-up installations in potentially explosive areas involves a great deal of precautions to be taken. For instance, the equipment, the resources, the cables and conductors as well as the construction have to meet special requirements. In case of doubt, the consultation of experts during the planning is recommended.

Risk assessment
It is the responsibility and duty of the user to perform a risk analysis prior to installing new facilities.
He must verify where there is a risk of explosion and then divide areas into zones accordingly. Every plant must be examined for its particularities.
The question of possible risks of explosion must be addressed at the early stages of new facility planning. When assessing the risks of explosion, the user should take into account factors such as the likelihood that explosive atmospheres will occur and their persistence, the possible occurrence of chain reactions and interactions with other installations, the scale of the anticipated effects, e.g. damages to the building to be expected and the effect of the explosion on further components of the plant.
The risk analysis requires a great deal of experience as well as a correct assessment.
In case of doubt, consulting experts on this matter is highly recommended, considering that the risk analysis builds the basis of all further measures to be taken before the installation can be put into operation.

Analysis of the explosion protection risk
The user of a machine or installation has to perform an accurate analysis according to the standards EN 60079-10, EN 60079-14 and EN 1127-1. On the basis of this analysis, he has to classify the areas in which explosive atmospheres may be present into zones. These observations must be documented.

Documentation of the explosion protection
The documentation is essential to ensure a safe operation of the installation in the potentially explosive area. It is drawn up prior to the set-up and must always be kept up-to-date.
In case of changes to the installation, all the described influences data must be taken into account.

Example of an explosion protection document
- Object responsible
- Called by name in the documentation
- Description of the structural/constructional and geographic conditions
- Layout plan, building map, plant ventilation system
- Procedure description, description of the installation under the scope of explosion protection
- Substance characteristics, list of all data including explosion-relevant parameters
- Risk analysis,
- Protection concept, zone classification, explosion protection types used
- Organisational measures
- Instructions, prescriptions in written, work authorisations

Classification of the potentially explosive areas into zones
To determine the necessary protective measures to be taken and to select appropriate equipment, the potentially explosive areas have to be classified into zones. This classification of the potentially explosive areas into zones is based upon the frequency and the duration of the presence of the dangerous explosive atmosphere.
These framework conditions (frequency, duration) determine the classification and identification of gas explosion risk areas as zone 0, 1 or 2 as well as the required measures to be taken in order to avoid active sources of ignition.
Dust explosion risk areas are accordingly classified as zone 20, 21 or 22.
The EN 60079-10 standard can provide help with the classification of gas explosion risk areas into zones. The zone definition is included in all common documentation, i.e. in the ATEX Directive 1999/92/EC as well.

Zone 0 is an area, in which an explosive atmosphere consisting of a mixture with air of flammable substances in the form of gas, vapour or mist is present continuously or for long periods or frequently.
- Example: these conditions are usually found only inside containers, pipes, apparatus (evaporators, reaction chambers etc.).

Zone 1 is an area, in which an explosive atmosphere consisting of a mixture with air of flammable substances in the form of gas, vapour or mist is likely to occur occasionally in normal operation.
- Example: areas in the immediate surroundings of zone 0, of intakes and inlets, the areas around filling units and discharging equipment, the immediate surroundings of highly fragile apparatus or conductors in glass, ceramics etc., the area around insufficiently sealing gaskets, e.g. on pumps and dampers, the interior of apparatus such as evaporators and reaction chambers.

Zone 2 is an area, in which an explosive atmosphere consisting of a mixture with air of flammable substances in the form of gas, vapour or mist is not likely to occur in normal operation but, if it does occur, will persist for a short period only.
- Example: areas surrounding zone 0 or 1, specific storage plants

Zone 20 is an area, in which an explosive atmosphere in the form of a cloud of combustible dust in air is present continuously or for long periods or frequently.
- Example: these conditions are usually found only inside containers, pipes, apparatus, e.g. mills and grinders, dryers, mixers, feed pipes, silos etc.

Zone 21 is an area, in which an explosive atmosphere in the form of a cloud of combustible dust in air is likely to occur occasionally in normal operation.
- Example: also areas in the vicinity of inlets or work stations where dust is poured into containers, as well as areas where there are dust deposits and where a combustible dust/air mixture could form in the course of normal operation.

Zone 22 is an area, in which an explosive atmosphere in the form of combustible dust in air is not likely to occur in normal operation but, if it does occur, will persist for a short period only.
- Example: this could also include areas in the vicinity of devices containing dust, protection systems or components from which dust leaks and forms deposits (e.g. milling/grinding facilities, from which dust leaks and forms layers)

Dust Ex: selection according to the smouldering temperature and the ignition temperature
When selecting electrical apparatus for use in dust explosion risk areas, the **smouldering temperature** of the deposited dust and the ignition temperature of the potentially explosive dust/air mixture must be known, regardless of the zone.
The smouldering temperature is the lowest temperature of a hot surface on which a dust deposit of a defined thickness is ignited.
The ignition temperature of a dust cloud is the lowest temperature of a heated wall of an oven that ignites the dust/air mixture upon brief contact.
Combustible dusts are not divided into temperature classes like gases. The maximum surface temperature must be mentioned on the electrical equipment.
The table below summarizes the explosion parameters (ignition temperature, smouldering temperature and minimum ignition energy) of a few dusts.

Please note that for flammable substances a collective name, e.g. mill dust, designates different kinds of that product, each of them with diverging safety characteristics and parameters. Wheat flour for instance has other parameters than rye flour.
The specific parameters of the dust, which is permanent in each dust explosive area, must be determinated.
When the parameters of collective names are used, miscalculations can occur.

Substance	Ignition temperature T_i [°C]	Smouldering temperature T_s [°C]	ø Minimum energy ø E_{min} [mJ]
Flour	≥ 380	≥ 300	≥ 30
Wood	≥ 410	≥ 200	≥ 100
Brown coal	≥ 380	≥ 225	–
Coal	≥ 500	≥ 240	≥ 1000
PVC	≥ 530	≥ 340	≥ 5
Aluminium	≥ 560	≥ 270	≥ 5
Sulphur	≥ 240	≥ 250	10

Types of protection
Essential requirements
The EN 60079-0 describes the essential requirements, which apply to all types of explosion protection.

Mechanical protection
Mechanical tests are carried out in accordance with EN 60079-0. The enclosures or the exterior part of the enclosure, pushbuttons must withstand highimpact energy.

Type of protection „n“ EN 60079-15
The type of protection “n” originally was used as stand-alone standard for use in ATEX category 3G respectively was defined as zone 2 standard in IECEx.
This standard has been designed for normal operation. The fault analysis, which is performed for the other types of protection, is not executed, considering that the explosive atmosphere and the ignition spark are very unlikely to occur simultaneously in zone 2; in other words: electrical apparatus cannot ignite an explosive atmosphere surrounding them in normal operation and under defined abnormal operating conditions.
Meanwhile, the EN 60079-15 has been re-written, so that the essential requirements are now described in the EN 60079-0.
This reflects for instance in the following way: The type of protection Ex nL has been replaced with the Ex ic type of protection relative to intrinsic safety. The sub-group is transferred from the EN 60079-15 into the EN 60079-11. This leads to changes, which could require a more accurate analysis.

Temperature classes for gases (EN 60079-0):

Classification of the maximum surface temperature into classes for electrical apparatus belonging to Equipment Group II

T1	T2	T3	T4	T5	T6
450°C	300°C	200°C	135°C	100°C	85°C

Subdivision of the type of protection „n“ Ex n in Europe

Symbol	Meaning	Comparable with	Method	Subdivision
A	Non-sparking	Ex e	Occurrence of electric arcs, sparks or hot surfaces is minimised	None
C	Sparking apparatus	Partially Ex d, Ex m	Enclosed switching device, non-explosive components hermetically closed, sealed or encapsulated devices	IIA, IIB, IIC
R	Vapour-tight enclosure	–	Penetration of explosive gases is reduced	None
L*	Energy limitation	Ex i	Energy limitation, so that neither sparks nor thermal effects can produce an ignition	IIA, IIB, IIC
P	Simplified pressurized enclosure	Ex p	Penetration of explosive gases is avoided by overpressure. The monitoring unit will not switch-off	None

*different in North-America and Europe

Intrinsic safety
Principle
The type of protection “intrinsic safety” Ex i is based on the principle of limitation of current, voltage and storable energy within an electric circuit. Intrinsic safety does not reduce the potentially explosive substance and/or the oxidizing agent.
The ignition of an explosive mixture is avoided, when neither electric sparks nor the effect of heat can occur. The voltage is limited in order to keep the electrical sparks below the ignition limit. The thermal effect, i.e. hot surfaces, is excluded by the current limitation.
The energy limitation avoids the excessive heating of the electrical apparatus and its surfaces.
This also applies to the sensors integrated in the intrinsically safe electrical circuits. Electrical energy can be stored in capacities (condensers) or inductivities (coils) within the intrinsically safe electrical circuit.

Zener diodes, which are used for limiting voltage, become conductive as of a specific voltage. The increased voltage is conducted through the zener diode, i.e. the electrical circuit in the EX zone has limited voltage.
A series-wired resistance limits the current in the potentially explosive area.

$I_{max} = I_o = U_o/R$

With the limitation of voltage and current, the maximum power is

$P_o = U_o^2 / 4R$

The authorised maximum values are taken from the ignition limit curves, defined in the EN 60079-11 standard. For the gas groups I, IIA, IIB and IIC, there are four ignition limit curves. The classification is done according to the ignition energy.
The ignition limit curves have been calculated by means of a spark tester, as described in the EN 60079-11 standard.

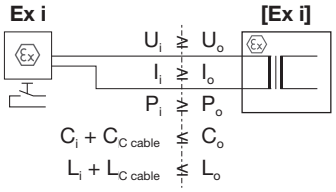

Ignition protection type and the main characteristics

Ignition protection type	Basic principle, main application
Oil immersion „o“	The source of ignition is permanently immersed in oil. Application: switchgear and transformers
Pressurized enclosures „p“	The formation of a potentially explosive atmosphere inside an enclosure is prevented by maintaining a positive internal pressure of protective gas in relation to the surrounding atmosphere. Application: machinery, commutation motors, control cabinets, monitors, keyboards, analysers
Powder filling „q“	A fine granular packing material surrounds the ignition source, thus making it impossible for an electric arc created in the enclosure under certain operating conditions to ignite a potentially explosive atmosphere surrounding the enclosure. Application: capacitors, condensers, electronic ballast, sensors
Flameproof enclosures „d“	Parts which can ignite a potentially explosive atmosphere are surrounded by an enclosure which withstands the pressure of an explosive mixture exploding inside the enclosure and prevents the transmission of the explosion to the atmosphere surrounding the enclosure. Application: switchgear, spark-generating parts, power engineering, heavy-current engineering
Increased safety „e“	Additional measures are applied to increase the level of safety, thus preventing the possibility of excessive temperatures and the occurrence of sparks or electric arcs within the enclosure or on exposed parts of electrical apparatus, where such ignition sources would not occur in normal service. Application: terminal and connection boxes (engines)
Encapsulation „m“	Parts that are capable of igniting an explosive atmosphere by either sparking or heating are enclosed in a compound in such way as to avoid ignition of an explosive atmosphere. Application: sensors, variable speed drives
Intrinsic safety „i“	An electric circuit is intrinsically safe if no sparks or thermal effects produced under specified test conditions are not capable of causing ignition of a given explosive atmosphere. Application: measurement and control technology
Intrinsically safe systems „i-SYST“	The entirety of interlinked and interconnected electrical apparatus, documented by a system description. Circuits used completely or partly inside hazardous areas are intrinsic safe.

Electrical apparatus and associated apparatus

An intrinsically safe electric circuit contains at least one electrical apparatus and one associated apparatus.
The electric circuits of the electrical apparatus meet the requirements of the intrinsic safety.
The electrical apparatus must only be connected to non-intrinsically safe circuits through associated apparatus. An associated apparatus possesses both intrinsically safe and non-intrinsically safe circuits. To separate the electric circuits, a zener diode or galvanic isolators are used. The EN 60079-11 describes this separation calls as a “safety barrier”.
Intrinsically safe electrical apparatus and intrinsically safe components from associated equipment are classified in different levels of protection “ia”, “ib” and “ic” according to EN 60079-11. This classification is included as of the 5th edition of the IEC Ex version.
The “ia” category basically offers the highest level of protection, “ib” a higher level of protection and “ic” a high level of protection.
The category “ia” or “ib” determines whether the protective circuit offers a single fault safety or a double fault safety. For protection level “ic”, no fault analysis is performed. Here the safety for normal operation is sufficient. Therefore, the standard EN 60079-14, chapter 12.3 recommends galvanic isolation for intrinsically safe circuits in zone 0, category “ia”.
For intrinsic safety, a fault analysis is performed to exclude explosion risks. However, no statement whatsoever is made with regard to the operational safety. This means that a functional total breakdown is, for the explosion protection standpoint, allowed.
The electrical apparatus may be used in zone 0 in accordance with the category. The associated apparatus are installed in the safe area, only the intrinsically safe electric circuits are installed in the potentially explosive area in accordance with the category.
Basically it is possible to apply further protection measures. So that the associated apparatus can be installed in zone 2 or even in zone 1.

Design of intrinsically safe electric circuits

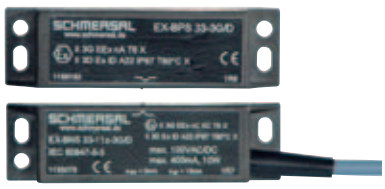

Design of intrinsically safe electric circuits (typical values)

Resistance (back/forth)	0,5 mm^2	72 Ohm/km
	0,75 mm^2	48 Ohm/km
	1,5 mm^2	24 Ohm/km
Capacity		180-200 nF/km
Inductivity		0,8-1 mH/km

Simple electrical apparatus – intrinsic safety

Type	Condition	Example
Passive components	None	Switches, terminal/junction boxes (modular enclosures), resistance, simple semi-conductor components
Energy storage	Values must be observed during calculation	Capacitors, coils
Energy source	≤ 1,5 V ≤ 100 mA ≤ 25 mW	Thermocouple, photocell

Cables for zones 0, 1 and 2
The cables must be laid in such manner that they are protected against mechanical damages, corrosion, chemical and thermal influences. This is an obligatory requirement for the type of protection “intrinsic safety”.
The accumulation of potentially explosive atmospheres must be prevented in shafts, pits, ducts, conduits and trenches.
The propagation of flammable gases, vapours, liquids or combustible dusts through shafts, pits, ducts, conduits and trenches must be prevented as well.
If possible, cables and conductors must be laid without interruption in the potentially explosive area. If this is impossible, the connection of cables must be realised in an junction box with the appropriate explosion protection type for that zone.
If deviation of this stipulation is required for installation reasons, the requirements of the EN 60079-14 standard must be observed.

Appropriate cables must be selected for intrinsically safe electric circuits. Furthermore, the following conditions apply to intrinsically safe electric circuits, also when they are installed outside of the potentially explosive area:

- Protection against the ingress of external energy.
- Protection against external electric or magnetic fields.
  Possible cause: overhead highvoltage line or 1-phase highvoltage lines.
- The conductors of intrinsically safe and non-intrinsically safe electric circuits must not be laid in the same conduit.
- In case of armoured, metal sheathed or shielded cables, intrinsically safe and non-intrinsically safe electric circuits can be laid in the same conduit.

In the control cabinet, the intrinsically safe electric circuits must be clearly marked. The standard prescribes no uniform procedure and only points out that for the marking preferably a light blue colour should be used.
However, the neutral conductors of energy cables are usually also marked with a blue colour. In order to avoid confusion, another marking should be used for the intrinsically safe electric circuits in this case.
What is important, is a conveniently arranged layout and a spatial separation in the control cabinet.

Conductive shields must only be earthed at places located outside the potentially explosive atmosphere.

Multiple intrinsically safe electric circuits may be wired in multi-wire cables or conductors.

Cable	Requirement	
Stationary apparatus	Enclosure	Thermoplastic, duroplast, elastomer or metal insulated with metal enclosure
Mobile, transportable apparatus	External enclosure	Heavy polychloroprene, synthetic elastomer, heavy rubber hose pipe or similar robust design
	Minimum section surface	1,0 mm^2
Flexible	Design	• Light rubber hose pipe with/without polychloroprene enclosure • Heavy rubber hose pipe with/without polychloroprene enclosure • Plastic-insulated cable, similar to heavy rubber hose pipe

Selection criteria for cables for the type of protection “intrinsic safety”

Criterion	Condition	Note
Insulated cables	Test voltage ≥ 500 VAC	Cable ground, cable shield and shield ground
Diameter of the individual conductors	≥ 0,1 mm	Also for flexible conductors
Flexible conductors	To be protected against splicing	e.g. by using conductor ferrules
Multi-wire cables	Acceptable	The requirements for the error analysis to EN 60079-14 must be observed
Parameters	(C_c and L_c) or (C_c and L_c/R_c)	In case of doubt: worst case

EN 13463

Mechanical explosion protection
The general requirements can be summarised as follows:
- The equipment must meet all stipulated application requirements (e.g. rough operation, humidity effects, ambient temperature and pressure fluctuations, influence of chemical agents, corrosion, vibrations) (refer to the operating instructions);
- Determination and evaluation of the ignition hazards
  – Apparatus interior (heating due to failure capable of causing ignition inside the device)
  – Dust deposits (friction between moving parts)
  – Evaluation of the surface temperature according to the category
- Documentation of the ignition hazard analysis
- Determine the maximum surface temperature for internal and external surfaces (for category 1 maximum 80 % of T1 ... T6)
- Prevention of mechanically generated sparks by friction, stroke and grinding processes (aluminium, magnesium, titan and zirconium portion in alloys and coatings to be limited in accordance with the category);
- All conductive parts must be grounded and protected against sparks produced by static electricity; disruptive discharge voltage of non-conductive layers on metallic surfaces smaller than 4 kV; surface resistance smaller than 10^9 Ohm
- Further detailed requirements depending on the equipment category and possible sources of ignition.

The maximum authorised mass portions for the material used for external parts in case an ignition hazard is present due to friction, stroke or friction sparks according to the ignition hazard evaluation, amount to:
- Category M1/M2: not more than 15% aluminium, magnesium, titan and zirconium in total as well as not more than 6% magnesium, titan and zirconium in total
- Category 1: not more than 10 % aluminium, magnesium, titan and zirconium in total as well as not more than 7.5 % magnesium, titan and zirconium in total
- Category 2: not more than 7.5 % magnesium,
- Category 3: no special requirements.

EN 13463-1, clause 5.2 “Evaluation of the ignition hazard” requires an assessment of the ignition hazards as well as a corresponding report in tabular form (example: refer to page 13). The ignition hazard assessment is used for the classification into equipment categories: “If an equipment has been designed and built in accordance with good engineering practices and the assessment of the ignition hazards ensures that under normal operation, the equipment has no potential source of ignition, the equipment can be classified into the equipment category 3.
If the ignition hazard assessment ensures that the equipment has no potential source of ignition in case of expected or rare malfunctions, it can be classified into the equipment category 2 or 1”.

Section 5.2.7 of the EN 13463-1 includes an assessment report for Group II equipment.

Constructional safety „c“
- Type of protection, in which constructional measures are applied to ensure protection against potential ignition by hot surfaces, sparks and adiabatic compressions generated by moving parts,
- Using proven technical principles,
- The probability of a dangerous failure is very low
- Observations with regard to the lifetime of ball and rolling bearings, distances between moving and fixed parts, rotation speeds higher than 1 m/s, electrostatic problem for belt transmissions.

Marking
- Basic requirement: the field of application of all EX-relevant equipment, protective systems and components must be identified.
- Marking example: ⟨Ex⟩ II 1G c T4

Assessment of the ignition hazard for equipment of Group II (EN 13463-1), gas

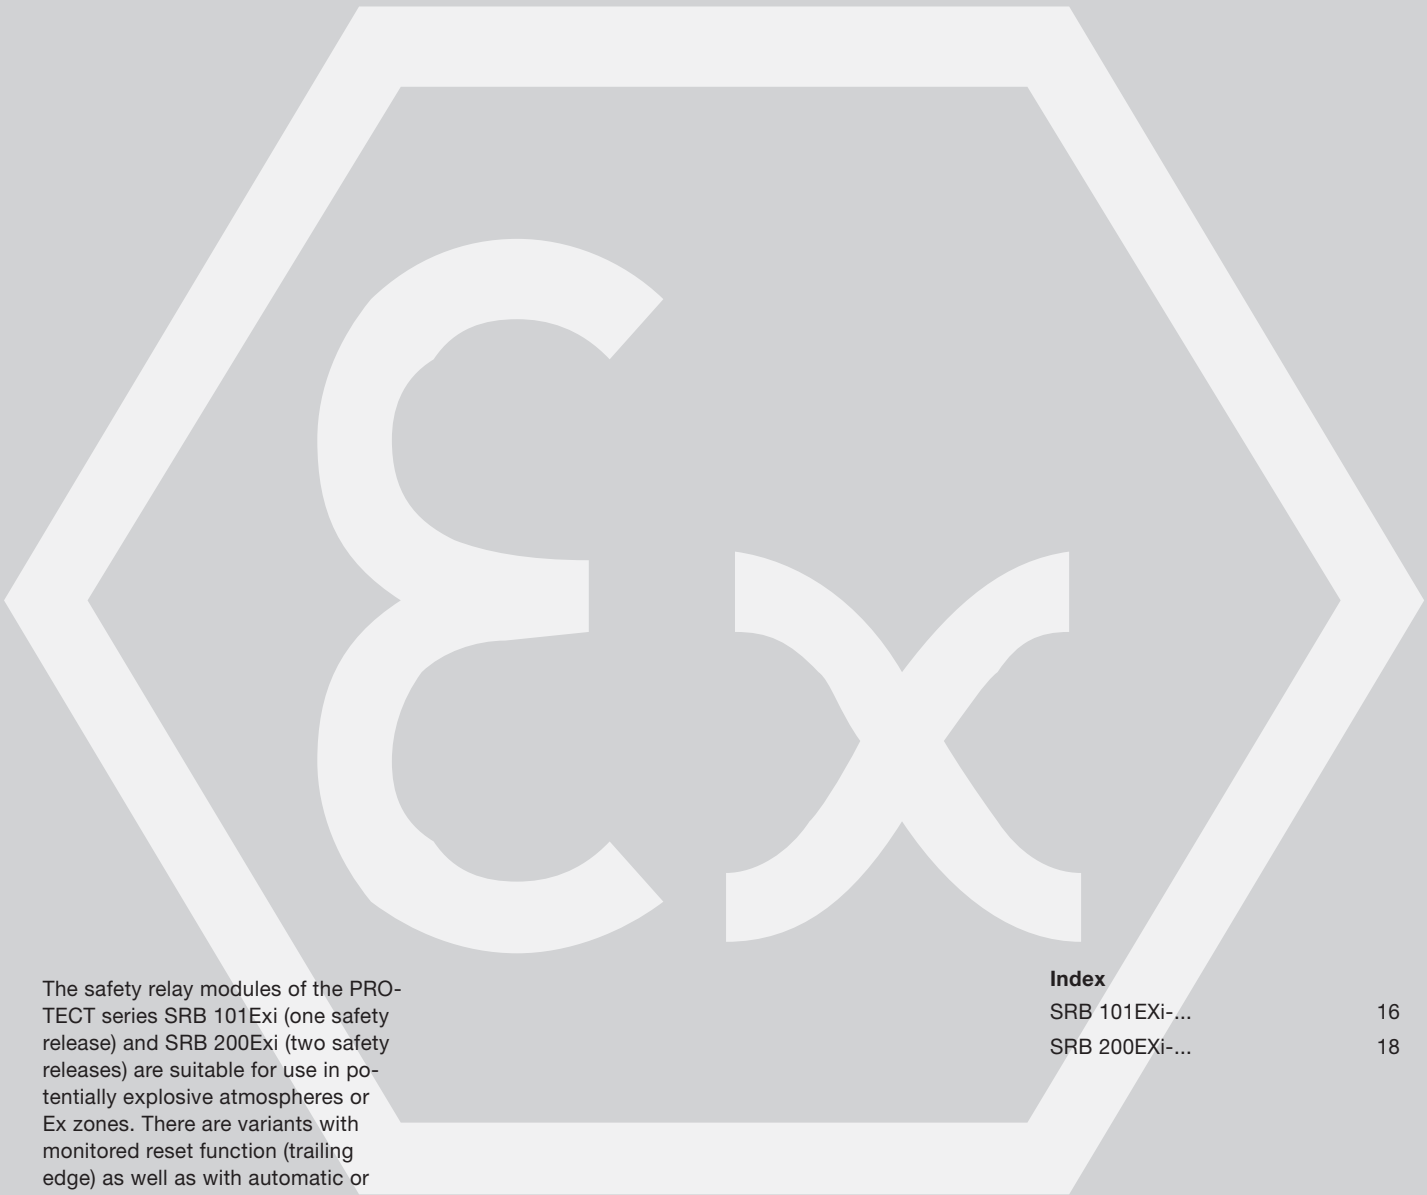

Potential ignition source (1)			Measures applied to prevent the source becoming effective (2)	Ignition protection used (3)
Normal operation (1a)	Expected malfunction (1b)	Rare malfunction (1c)		

Columns (1b) and (1c) are only required, when the definition of the equipment category of Group II requires that they must be protected in case of specific malfunctions, e.g. for equipment category 2 or 1.
The manufacturer of the equipment performs and documents the risk analysis of the ignition hazard. The user must also perform a risk analysis for the equipment, which was integrated in the machine at the time when it did not had to meet the requirements of the ATEX 1999/92/EC.

Products with the type of protection “intrinsic safety”

The safety relay modules of the PROTECT series SRB 101Exi (one safety release) and SRB 200Exi (two safety releases) are suitable for use in potentially explosive atmospheres or Ex zones. There are variants with monitored reset function (trailing edge) as well as with automatic or manual reset function.
All these versions have a stop 0 safety release and optionally can be supplied with cross-wire short detection.

SRB 101EXi-...

- 1- or 2-channel control
- 1 safety enabling circuit
- Suitable for signal processing of emergency stop control devices, interlocking equipment, etc.
- 1 additional signalling contact (auxiliary contacts must not be used in safety circuits)
- Trailing edge (version -1R)
- Automatic reset function (version -1A)
- Optionally cross-wire short detection (through switch)
- Current and voltage limitation of the input circuits (intrinsically safe)
- Green LED indications for relays K1, K2, U_B, U_i and U_{EXi}
- DIN rail mounting to DIN EN 60 715:2001
- Thermoplastic enclosure to UL-94-V-0, graphite black RAL 9011
- Certification to DIN EN ISO 13 849-1:2007
- Certification to ATEX 94/9/CE
- Electric circuits up to zone 1/21
- Installation in zone 2 possible

Technical data

Equipment category, explosion protection type:	Gas: ⟨Ex⟩ II 3 G Ex nAnC IIC T5 (SRB in zone 2)
	Gas/dust: ⟨Ex⟩ II (2) GD [Ex ib] IIC/[Ex ibD]
Inputs (S11-S12, S21-S22, X1-X2/X3):	[Ex ib] IIC/[Ex ibD]
Temperature class:	T5
Voltage U_o:	33,6 V
Current I_o:	57,0 mA
Capacity P_o:	478,8 mW (linear characteristic)
Maximum safety voltage U_m:	253 VAC
Isolation:	safe separation to EN 60079-11:
	Amplitude of the voltage 375 V
Rated operating voltage:	24 VDC –15%/+20%, residual ripple max. 10%
Recommended fuse for the operating voltage:	internal fuse F1: T 50 mA/250 V
	internal fuse F2: T 100 mA/250 V
Protection class:	enclosure: IP 40
	Terminals: IP 20
	Wiring compartment: IP 54
Power consumption:	max. 3,0 W
Switching capacity of the enabling paths:	230 V; 3 A ohmic
	(inductive with suitable protective circuit)
	AC-15: 230 VAC/3 A
	DC-13: 24 VDC/3 A
Recommended fuse for the enabling paths:	3,15 A slow blow
Min. switching capacity:	min. 10 V/10 mA
Contact resistance:	max. 100 mΩ in new state
Contact material/contacts:	AgSnO, self-cleaning, positive drive
Switching capacity of the auxiliary contacts (21-22):	24 VDC, 2 A
Recommended fuse for the auxiliary contacts:	2 A slow blow
Current and voltage at S11-S12, S21-S22:	24 VDC, 5 mA
Current limitation at S11-S12, S21-S22:	15 mA
Pull-in delay:	ca. 300 ms (Version -1A)
	ca. 20 ms (Version -1R)
Drop-out delay:	in case of emergency stop: approx. 20 ms
	in case of voltage drop: approx. 20 ms
bridging in case of voltage drops:	ca. 15 ms
Air clearances and creepage distances:	EN 60664-1:2003 (DIN VDE 0110-1), 4 kV/2
	EN 60079-11:2007 (VDE 0170/0171 Teil 7)
Max. total line resistance:	30 Ohm
Ambient operating:	–25 °C ... +60 °C
EMV:	EN 61000-6-2:2005
Vibrations:	EN 60068-2-6:1996
Frequency:	10 … 55 Hz
Amplitude:	0,35 mm
Climatic resistance:	EN 60068-2-3:1986
Storage temperature:	–40 °C ... +85 °C
Mechanical life:	10^7 operations
Weight:	230 g
Dimensions:	22,5 x 100 x 121 mm

SRB 101EXi-1①

No.	Replace	Description No.
①	R	trailing edge
	A	automatic reset function

Note

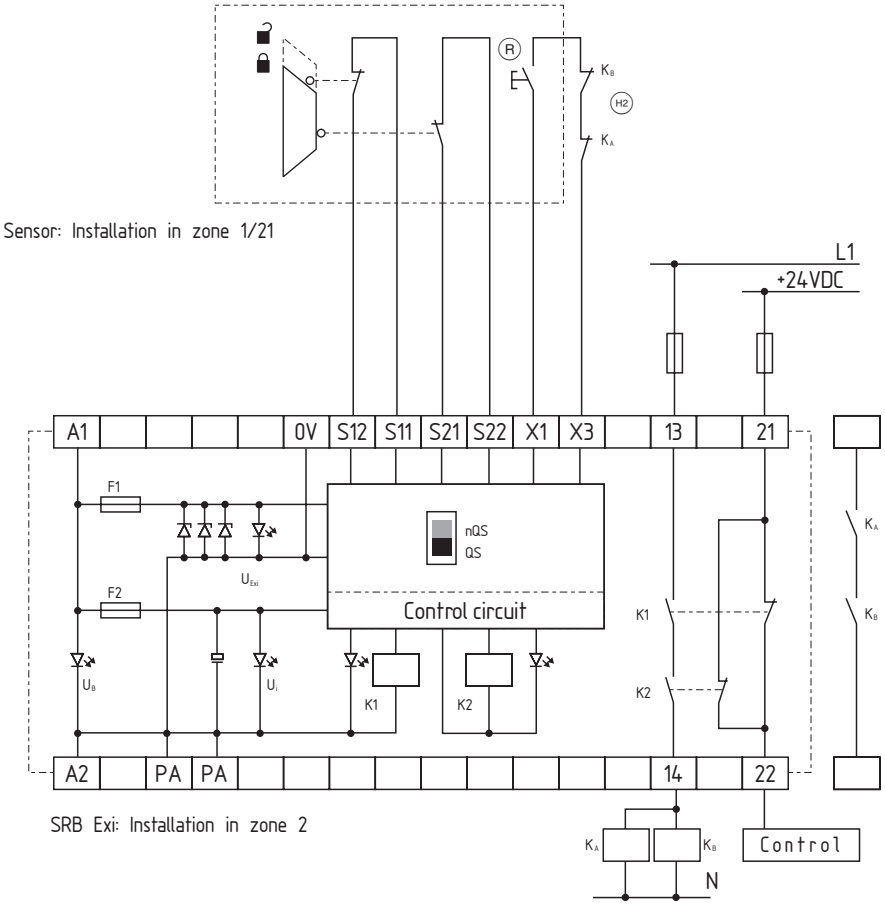

- Cable connections:
  single strand: rigid or flexible (with or without conductor ferrules) 0.25 … 2.5 mm²
  multi-strand with identical section: rigid or flexible (with conductor ferrules without plastic) 0.25 … 2.5 mm²; flexible (without or with TWIN conductor ferrules) 0.5 … 1.5 mm²
- Cable lengths (for nominal voltage):
  1-channel without cross-wire short detection:
  1.5 mm² = 1,500 m; 2.5 mm² = 2.500 m
  2-channel with/without cross-wire short detection:
  1.5 mm² = 1,500 m; 2.5 mm² = 2.500 m

SRB-EXi safety relay module

Note

- 2-channel control, shown for a guard door monitor with two position switches whereof one with positive break contact; with external reset button Ⓡ.
- Relay outputs: 2-channel control, suitable for contact reinforcement or multiplication by means of contactors or relays with positive-drive contacts.
  Ⓗ2 = feedback circuits
- The control recognizes cable break, cross-wire shorts (switch in position “QS”) and earth leakages in the monitoring circuit.
- The safety function is defined as the opening of release 13-14 when the inputs S11-S12 or S21-S22 are opened.
- The safety-relevant current path with output contact 13-14 meets the following requirements under observation of a B10d value assessment (also refer to “Requirements of DIN EN ISO 13 849-1“):
  – Category 4 – PL “e”
  to DIN EN ISO 13 849-1:2007
  – SIL 3 to DIN EN 61 508-2:2002
  – SILCL 3 to DIN EN 62 061:2005 (meets the requirements of control category 4 to DIN EN 954-1:1997).
- To determine the Performance Level (PL) of the entire safety function (e.g. sensor, logic, actuator) to DIN EN ISO 13 849-1:2007, an analysis of all relevant components is required.

Simple electric apparatus, type of protection “intrinsic safety”

The described devices can be used as simple electric apparatus in intrinsically safe electric circuits to EN 60079-11. In combination with the aforementioned safety relay modules of the PROTECT SRB series, these products meet the requirements of intrinsic safety. Detailed information can be found in the operating instructions.

Safety switch with separate actuator

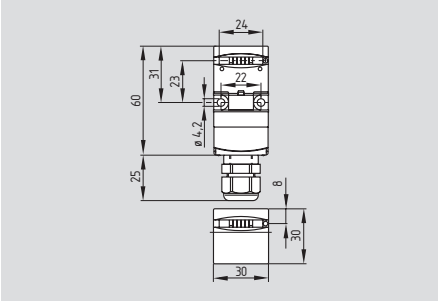

In the class 2 safety switches, the switching element and the actuator are not physically connected, but brought together or separated upon switching. When the safety guard is opened, the actuator is separated from the base unit. During this process, the NC contacts in the safety switch are positively opened and the NO contacts closed.

EX-AZ 415-…-3D

A: setting screw ball latch 30 - 500 N

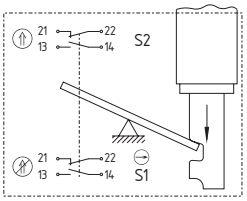

- Ex certified
- Metal enclosure
- 2 switches with different actuating functions in a single enclosure
- Long life
- High level of contact reliability with low voltages and currents
- Adjustable ball latch to 500 N
- Spring-loaded actuators
- 2 cable entries M20 x 1.5
- Including EX-certified screwed cable gland and screw plug

Technical data

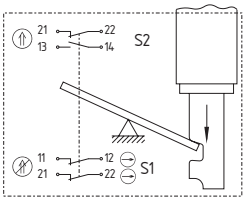

Equipment category:	⟨Ex⟩ II 3D
Ex protection:	Ex tD A22 IP67 T60°C X
Standards:	IEC 60947-5-1 IEC 61241-1 BG-GS-ET-15
Enclosure:	light-alloy diecast, paint finish
Max. impact energy:	4 J
Actuating speed:	max. 1 m/s
Actuator:	zinc-plated brass/ aluminium
Protection class:	IP 67 to IEC/EN 60529
Contact material:	silver
Contact type:	change-over contact with double break, type Zb or 2 NC contacts, with galvanically separated contact bridges
Switching system:	⊖ IEC 60947-5-1 slow action, NC contact with positive break
Connection:	screw terminals
Cable section:	max. 1.5 mm², min. 0.75 mm² (incl. conductor ferrules)
Cable entry:	2 x M20 x 1.5
U_{imp}:	4 kV
U_i:	250 V
I_{the}:	6 A
Utilisation category:	AC-15
I_e/U_e:	4 A / 230 VAC
Max. fuse rating:	6 A gG D-fuse
Positive break travel:	3.8 mm
Positive break force:	min. 31 N
Ambient temperature:	– 0 °C … + 50 °C
Mechanical life:	> 1 million operations
Latching force:	30 - 500 N (adjustable)
Cable cross-section of the cable glands:	min. Ø 6 mm max. Ø 12 mm

Note

Included in delivery
- Mounting plate for safety switch
- Actuator incl. mounting plate
- Emergency handle (For variant -05 and -06 incl. mounting plate)

Ordering example
To order, first choose the desired safety switch and then the door handle system:
for example EX-AZ 3350-12-zük-U90 and EX-AZ 3350-STS30-02.

Ordering details

The drawings are always shown with a view to the switch.

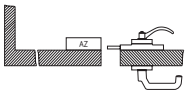

When the TF. centring device is used, the maximum actuating speed for closing the safety guard is limited to 1 m/s.

www.schmersal.com

Solenoid interlocks

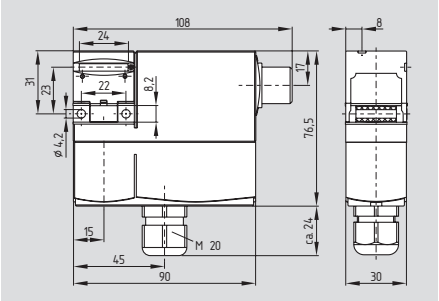

In the solenoid interlocks of the EX-AZM series, the switching element with interlocking device and the actuator are not physically connected, but brought together or separated upon switching. When the safety guard is opened in unlocked condition, the actuator is separated from the base unit. During this process, the NC contacts are positively opened and the NO contacts closed. Interlocking is carried out by means of a blocking bolt/latching bolt. This latching bolt blocks the actuator so that it cannot be withdrawn from the interlock. The machine control is only enabled when the actuator has been inserted into the interlock and the latching bolt is in blocking position. This is ensured by the contact monitoring of the latching bolt.

Straight actuator AZ/AZM 415-B1

EX-certified screwed cable gland

EX-certified screw plug

Note

Interlocks with power to lock principle may only be used in special cases after a thorough evaluation of the accident risk, since the guarding device can immediately be opened on failure of the electrical power supply or when the main switch is opened.

Ordering details

Straight actuator	**AZ/AZM 415-B1**
EX-certified screwed cable gland	**EX-KLE-M20x1,5**
EX-certified screw plug	**EX-VS-M20x1,5**

More Details

Detailed technical information at:
www.schmersal.com

Position switches with safety function

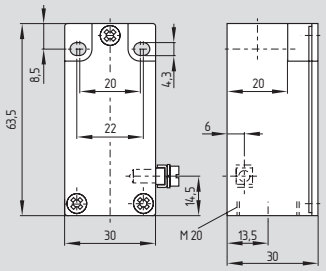

The position switches with safety function are suitable for sliding and hinged safety guards, which need to be closed to ensure the required operational safety.

EX-Z/T 235-...-3D

- Ex certified
- Mounting details to EN 50047
- Metal enclosure
- Available with 2 positive break NC contacts
- Snap action with constant contact pressure up to switching point
- Slow action available with overlapping or staggered contacts
- Wiring compartment
- Wide range of alternative actuators
- Actuator heads can be repositioned by 4 x 90°
- Angle of roller lever adjustable in 10° steps
- Good resistance to oil and petroleum spirit
- Metal roller available on request
- 1 cable entry M20 x 1.5
- Including EX-certified screwed cable gland

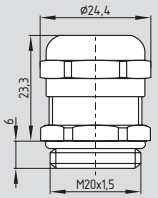

Approvals

CE

Technical data

Equipment category:	⟨Ex⟩ II 3D
Ex protection:	Ex tD A22 IP67 T90°C X
Standards:	IEC 60947-5-1 IEC 61241-1 BG-GS-ET-15
Design:	fixings to EN 50047
Enclosure:	zinc die-cast, enamel finish
Max. impact energy:	1 J
Actuating speed:	max. 1 m/s
Protection class:	IP 67 to IEC/EN 60529
Contact material:	silver
Contact type:	change-over contact with double break, type Zb or 2 NC contacts, with galvanically separated contact bridges
Switching system:	⊖ IEC 60947-5-1 slow or snap action, NC contacts with positive break
Connection:	screw terminals
Cable section:	max. 2.5 mm², min. 0.75 mm² (incl. conductor ferrules)
Cable entry:	1 x M20 x 1.5
U_{imp}:	6 kV
U_i:	500 V
I_{the}:	10 A
Utilisation category:	AC-15, DC-13
I_e/U_e:	4 A / 230 VAC 1 A / 24 VDC
Max. fuse rating:	6 A gG D-fuse
Ambient temperature:	– 20 °C ... + 60 °C
Mechanical life:	20 million operations
Switching frequency:	max. 5000/h
Bounce duration:	snap action: < 3 ms; slow action: in accordance with actuating speed
Switchover time:	snap action: > 5.5 ms; slow action: in accordance with actuating speed
Cable cross-section of the cable glands:	min. Ø 6 mm max. Ø 12 mm

Ordering details

EX-certified screwed cable gland	**EX-KLE-M25x1,5**

Plunger S

- Actuating speed 1 m/s with an actuating angle of max. 20°
- Roller levers J and X can be subsequently fitted at plunger S.

Actuation from the side of the plunger should be avoided, since this reduces the mechanical life of the position switch.
Recommendation: use roller lever

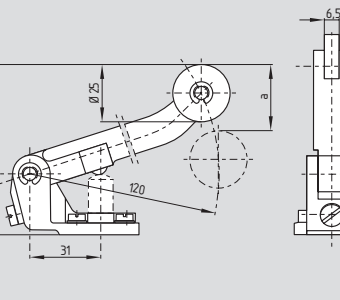

Offset roller lever J

- Actuating speed max. 0.5 m/s with an actuating angle of α = 45° and β = 30°
- Plastic roller (metal roller on request)
- Actuator head can be repositioned in steps 4 x 90°
- Available with rubber roller, ordering suffix -1

Actuation from the right should be avoided, since this reduces the mechanical life of the position switch.

Offset roller lever X

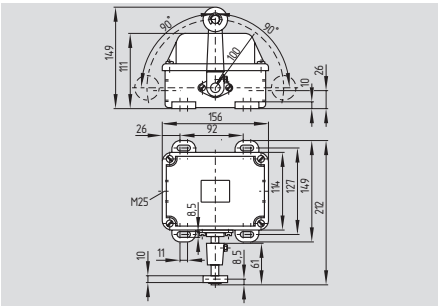

- Actuating speed max. 0.5 m/s with an actuating angle of α = 45° and β = 30°
- Plastic roller (metal roller on request)
- Actuator head can be repositioned in steps 4 x 90°

Actuation from the right should be avoided, since this reduces the mechanical life of the position switch.

Legend
α: Actuating angle from right of switch axis
β: Actuating angle from left of switch axis

Belt alignment switches

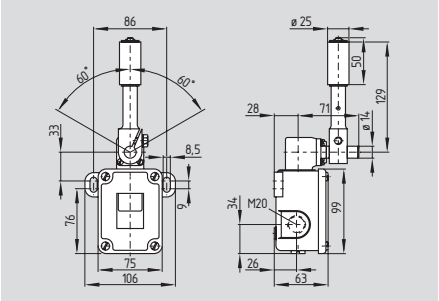

The belt alignment and slack-wire switches are suitable for use on material handling equipment. The belt alignment switches are actuated, when the conveyor belt becomes misaligned.
Depending on the plant set-up, this signal can be used to switch off the machinery or plant either to provide an automatic correction of the belt alignment.

Safety sensors

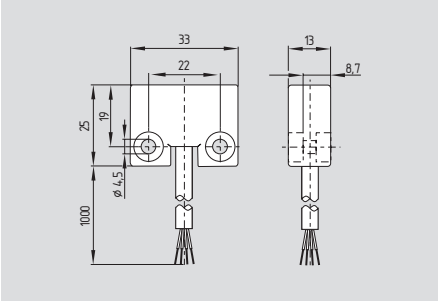

The use of magnetic safety sensors is of particular advantage, in cases where extremely dirty conditions can occur. This is provided by the simplicity of cleaning of the devices. Another advantage is the possibility of concealed mounting behind non-magnetic materials.
Working surfaces and storage areas can be designed without dust-collecting edges or other functional cut-outs and structures.
In applications, where a precise approach is not possible and larger tolerances are required, the magnetic safety sensors of the BNS series can be used as well.

EX-CSS 8-180-2P+D-M-L-3G/D

Pre-wired cable:
2 m length;
cable section 7 poles: 7 x 0,25 mm^2

Wiring

Color	Wiring
N (brown)	A1 Ue
BU (blue)	A2 GND
VT (violet)	X1 safety input 1
WH (white)	X2 safety input 2
BK (black)	Y1 safety output 1
RD (red)	Y2 safety output 2
GY (grey)	diagnostic output

Evaluation

Requirements for the safety monitoring module
2-channel p-type safety input. The safety monitoring module must tolerate internal functional tests of the sensors in milliseconds (max. 2 ms).

A range of suitable safety monitoring modules for these applications can be found in the „Electronic Safety Sensors and Solenoid Interlocks“ brochure.

Note

- Series-wiring of sensors:
  16 self-monitoring CSS 180 safety sensors can be wired in series without loss ot control category 4 to EN 954-1. The redundant output of the first sensor is wired into the input of the next sensor.
- The voltage drop over a long sensor chain should be taken into account when planning cable routing. It depends on several factors which are operating voltage, cable length, ambient temperature, number of sensors series connected, and input load of the safety control monitor.

Magnetic reed switches

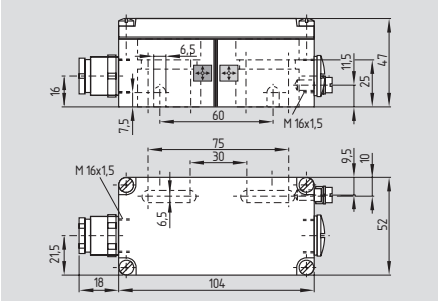

Magnetic reed switches are often used to replace mechanically actuated limit switches with plungers, roller and turning levers and as important connecting element for non-contact limit switches.

Cable entry:	2x M16 x 1.5
Mode of operation:	magnetic
Switching voltage:	max. 250 VAC/DC
Switching current:	max. 3 A
Switching capacity:	max. 120 VA/W
Dielectric strength:	> 600 VAC (50 Hz)
Switching speed:	max. 18 m/s
Switching frequency:	max. 300 S/s
Switching time “Close”:	0.3 ms ... 1.5 ms
Switching time “Open”:	max. 0.5 ms
Bounce duration:	0.3 ms ... 0.6 ms
Ambient temperature:	– 15 °C ... + 70 °C
Storage and transport temperature:	– 25 °C ... + 70 °C
Mechanical life:	1 billion operations
Electrical life:	1 million - 1 billion operations, depending on load
Resistance to vibration:	50 g on sine wave oscillation
Switching point accuracy:	± 0.25 mm, T = constant
Resistance to shock:	30 g / 11 ms
Resistance to vibration:	10 ... 55 Hz, amplitude 1 mm
Cable cross-section of the cable glands:	min. Ø 6 mm max. Ø 10 mm

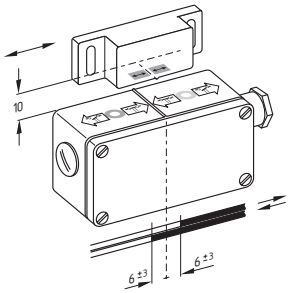

Switching distances, refer to next page.

Control devices and indicator lights

The entire EX-R programme has a modular structure. Each control device consists of contact elements, a contact holder, the mounting flange and the operating or display element. The modular structure facilitates assembly and fitting and allows a great diversity of variants: various versions of pushbuttons and illuminated buttons, indicator lights, emergency-stop buttons, selector switches and key-operated selector switches are available.

Control devices and indicator lights

Design
With the development of the new programme of 22 mm Ex control devices and indicator lights, Elan provides the user with a state-of-the-art switchgear concept that is compliant to EN 61241 and EN 60 079, featuring additional device functionality, reliability and spatial use beyond the usual standard. The EX-RF/RLDE contact and light element system makes a special contribution here.
Well-tried and proven features and material from earlier Elan designs (metal front parts, caps in high-quality shock-proof thermoplastic) have been retained and improved.

The equipment is suitable for the Ex category II 2GD. The explosion protection or the type of protection of the devices is:
• Ex ib IIC T4 X
• Ex tD A21 IP65 T110°C X

Control devices and indicator light heads
A large diversity of fully insulated pushbuttons/impact buttons/illuminated buttons/pivoting pushbuttons etc. is offered.
The front part of the actuating heads is in chrome-plated brass. The programme is characterised by large actuating surfaces of at least 28 mm. The material of the button is brass-coated.
The caps or lens covers of the illuminated pushbuttons and indicator lights are in shock-proof thermoplastic. In addition to the high mechanical strength, this material selection permits a more than average degree of resistance to heat and chemical effects.

Protection class
The front seal of these devices corresponds to protection class IP 65 to EN DIN 60 529. The design features of the device sealing guarantee the high type of protection over a long period of time, even in extreme conditions.

Mechanical protection
The requirements placed on the enclosure or external parts of the enclosure, e.g. the pushbuttons, are defined in the standard EN 60 079-0. The mechanical resistance is tested by means of the shock resistance test, in which the devices must withstand a defined high-impact energy.

Programme structure
A control and indicator device consists of an actuator, a mounting flange and a contact or light element. The type designation of this type series starts with EX-R…, e. g. EX-RDT for a pushbutton. The mounting flange (divided into two, type EX-RLM) is included in the delivery of the device heads, both for the operating and the display elements.

Per control device, a maximum of 2 contact elements is provided.

One-hole fixation
The devices are designed for mounting holes of 22.3 mm + 0.4 mm according to DIN EN 60 947-5-1 Pt. 6.3.1. An additional cut-out to prevent rotation is not required.

Grid dimensions
It is possible to install several devices with minimum dimensions in the following way:

Minimum distance between the mounting holes to DIN EN 60 947-5-1:
• horizontal: 40 mm
• vertical: 50 mm

Exceptions:
Selector switches/pushbuttons with long knob, emergency stop buttons EX-RDRZ45...:
• horizontal: 50 mm
• vertical: 60 mm

Simple electrical apparatus – intrinsic safety

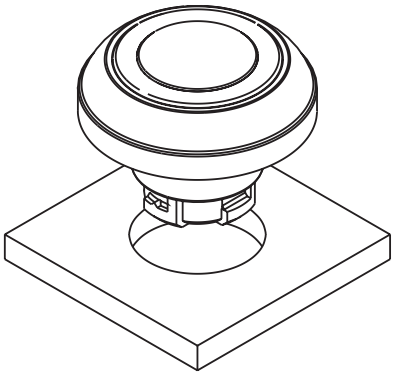

Type	Condition	Example
Passive components	None	Switches, terminal/junction boxes (modular enclosures), resistance, simple semiconductor components
Energy storage	Values must be observed during calculation	Capacitors, coils
Energy source	≤1,5 V ≤100 mA ≤25 mW	Thermocouple, photocell

Mechanical protection to EN 60 079-0

Risk of the mechanical hazard	High		Low	
Group	I	II	I	II
Enclosure and external accessible parts of the enclosure	20 Nm	7 Nm	7 Nm	4 Nm
Translucent parts without safety guard	7 Nm	4 Nm	4 Nm	2 Nm
	No further protective measures required		Mechanically protection fitting

EX-Trapped key system

The fundamental functional characteristic of a trapped key system is that, depending on the operating condition of the machine control, the key is trapped and cannot be withdrawn either

- in automatic mode (with the safety guard locked) in a control element, usually a key-operated selector switch or
- if the safety guard is open (in an electrically de-energised condition), in the guard locking device, i.e. a lock

In other words, an essential feature of the system is that the removable key is trapped either in the guard locking device or in the switch lock.

EX-Trapped key system

Functional characteristic

The fundamental functional characteristic of a trapped key system is that, depending on the operating state of the machine control system, the key is trapped and cannot be withdrawn either

- in automatic mode (with the guard locked) in a control element (usually in a key-operated selector switch) or
- in the guard locking device, namely in a lock, if the guard is open (in an electrically de-energised state).

In other words, a principle feature of the system is that the removable key is trapped either in the guard locking device or in the switch lock.

The locking device of the guard is designed in such a way that the trapped key can only be enabled if the guard is closed and locked (fail-safe). Only in this way can the key be transferred from here to the key-operated selector switch.

When the machine control system is switched on the key is trapped and cannot be removed for as long as the switch is set to ON.

If the transfer time between the opening of the key-operated selector switch and the locking of the guard is not sufficient for a hazardous machine motion to come to a standstill, a key-operated selector switch interlocking device may also be required.

Framework conditions

When using the SHGV safety door interlocking system it must be ensured that

- the time between switching off at the control panel and access to the guard is greater than the stopping time of any hazardous motion, or that the key-operated selector switch interlocking device of the type SVE is used;
- only one key is used in the trapped key system and any spare keys available are stored carefully;
- the separate actuators of the SHGV guard locking devices are fitted to the guard in such a way, e.g. with the non-reusable screws supplied with the equipment, that they cannot be released by simple means;
- the entry throat for the separate actuator is fitted in the guard locking device in a concealed position where at all possible. This recommendation applies generally to interlocking devices with separate actuator.

Please note:

- Owing to the trapped key system the systems are less suited to charging doors or moving guards with more frequent access.
- Even if key and lock barrel have 200 individual cuts / tumbler arrangements, a key can be copied in the same way as a separate actuator. Any damage caused as a result of such wilful manipulation of a guard no longer falls within the protection of statutory accident insurance (otherwise there would also be no BG test certificate for the SHGV system) for example.
- Every SHGV system comes with a spare key should the original one be lost under the strict condition that it is kept carefully and not used in the operational key transfer procedure.

SHGV/ESS key-operated selector switch

The SHGV/ESS key-operated selector switch as control element to interrupt or switch off automatic mode.

SVM solenoid interlock with key-operated selector switch
The SVM solenoid interlock with key-operated switch is used when multiple guards must be operated with one key selector switch.

Guard locking device Type SHGV

The design of the Guard locking device SHGV is based on that of a position switch with separate actuator, but the function of the position monitoring and locking is based exclusively on a mechanical principle of operation using the integrated lock barrel and the positively connected mechanism as well as the interaction between actuator and the articulating mechanism in the device head.

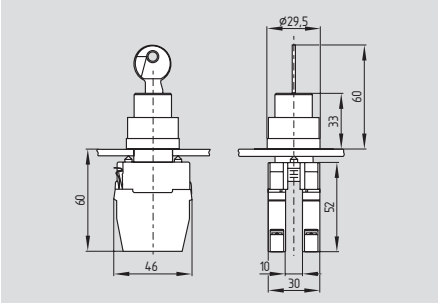

Version with a second lock barrel

The version with a second lock barrel using which the operation of lock barrel 1 can be blocked if an operator needs to access a room and wishes to protect himself from unintentional start-up of the machine control system by a third party.
