About Universal PCI

Increasingly, modern PCs are coming with 3.3V PCI slots. The change from 5V to 3.3V signalling on the PCI bus is a result of the technical advances made by leading PC manufacturers such as Dell, HP and Compaq to increase system speed while reducing onboard PC power consumption. What this means is that many new PC systems no longer use 5V signalling on the PCI bus, and 5V-only PCI cards cannot be used in these PCs. As part of our continued commitment to designing and manufacturing leading edge serial RS232 technology, we now offer the Universal PCI range that can work in both 5V and 3.3V signalling environments. This allows new and existing customers to have an easy migration path to this new technology.

Designed for Microsoft® Windows®XP

Description

Universal PCI card protects your investment into the future.

This card provides four industry standard 9-pin RS232 serial COM ports using just a single PCI slot. The fourth port is a flying lead header which can be either connected to an available slot or knock-out on the chassis.

As PCI is fully Plug & Play compatible, the operating system or BIOS automatically configures the card ensuring conflict free installation.

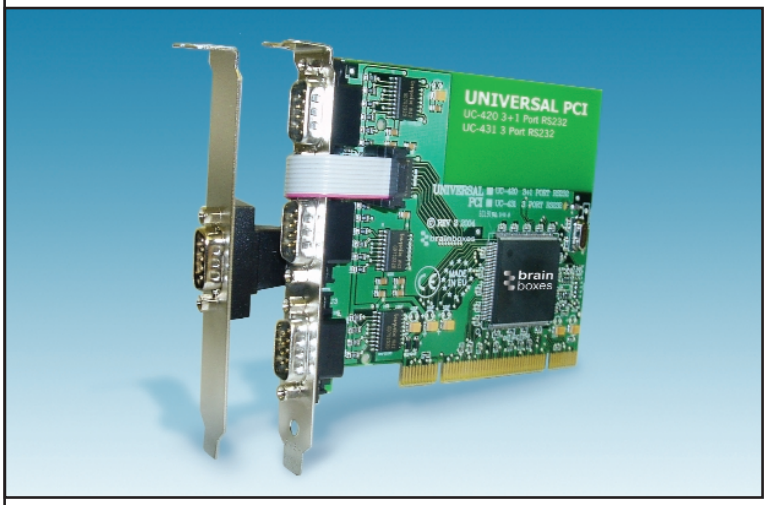

Software

Serial Solutions Device Driver CD contains software for Windows Server 2003, Windows XP, Windows 2000, Windows Millennium, Windows 98, Windows 95, Windows NT4 and Linux support.

Windows Server 2003, Windows XP & Windows 2000 signed drivers.
