LIGHT INDUSTRIAL NON - FERROUS METAL POLISHING KIT

This kit produces a 'mirror finish' on non-ferrous metals. The kit incorporates a unique non-loosening reverse-wound arbor that can be drill mounted or used in a bench grinder.

To produce a mirror finish two polishing stages are required starting with the harder 290 mop and the brown lustre composition at between 2500 and 3000 rpm.
The polishing compound is applied to the underside of the rotating mop with the mop rotating away from the bar.

To produce a mirror finish the softest M05 mop is applied using the blue Steelbrite polishing compound. Again the polishing compound is applied to the underside of the rotating mop with the mop rotating away from the bar. The metal can be polished to a mirror finish with the rotation set between 2500 and 3000 rpm.

Always observe normal polishing safety rules and wear protective goggles and dust mask if necessary.

P.O. Box 14, Wigston, Leicester, England, LE18 1AT.
