LIGHT INDUSTRIAL WOOD POLISHING KIT

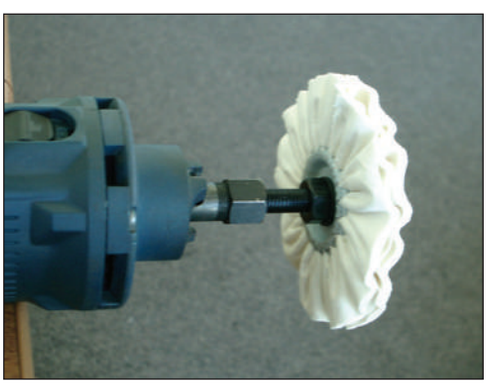

This kit produces a 'mirror finish' on most types of wood. The kit incorporates a unique non-loosening reverse-wound arbor that can be drill mounted or used in a bench grinder.

The denibbing tool consists of a non-woven coated abrasive material wound onto a metal ring. It requires no polishing composition and should be used at speeds between 1400 and 2000 rpm.

After denibbing the same arbour can be used to mount the two polishing mops in turn. To produce a mirror finish two polishing stages are required starting with the harder mop, and then finishing with the softer mop. The polishing compound Dialux Vonax is used with both mops and should be applied to underside of the rotating mop with the mop rotating away from the bar. Using this method the wood can be polished to a mirror finish with the rotation set between 3000 and 4000 rpm.

Always observe normal polishing safety rules and wear protective goggles and dust mask if necessary.
